

1. Data table list

NICU_Ototox_Repo_cohort	Public cohort table of all infants with usable audio results
NICU_Ototox_Repo_testages	Age at testing for DPOAE, wideband, and tbABR
NICU_Ototox_Repo_scrnABR	Low-level click ABR screening from visit 1 in NICU (35 dB nHL)
NICU_Ototox_Repo_cABR	Neurodiagnostic click ABR from visit 2 (70 dB nHL)
NICU_Ototox_Repo_tbABR	Tone-burst ABR air conduction Wave V visit 2, format long by ear/frequency (Hz)
NICU_Ototox_Repo_wideband	Wideband absorbance from visits 1 and 2, formatted long by ear/frequency (Hz)
NICU_Ototox_Repo_DPOAE	DPOAE from visits 1 and 2, formatted long by ear/frequency (Hz)
NICU_Ototox_Repo_Restricted	Restricted table with clinical and demographic variables

2. Missing values

7777	unknown
8888	not applicable
9999	prefer not to say
9998	attempted but failed
9997	not attempted
9996	no visit

3. Corrected age definition

Most of the data tables contain fields named [cagedays] or with *cagedays as a suffix. This is **corrected age** and is calculated as chronological age (days) minus the difference between full term (38 weeks * 7 days) and gestational age at birth, in days. In other words, (corrected age) = (chronological age) - [(38 weeks) - (gestational age at birth)]. Equivalently, (corrected age) = (chronological age) + (gestational age at birth) - (38 weeks).

Example: A child with gestational age at birth of 36 weeks and 3 days and a chronological age of 23 days has

$$\text{corrected age in days} = 23 + [(36 * 7) + 3] - (38 * 7) = 23 + 255 - 266 = 12 \text{ days}$$

4. Public data table details

NICU_Ototox_Repo_cohort

Public cohort table of all infants with usable audio results

Observations: 309

Variables: 43

Variable notes

[sepgent3N]:

1. Calculated from [ge3dmaxgent] and [sepsis_sus]

	Field_Name	Label	Type	Obs	Unique	Mean	Min	Max	Values
